Day #4 (1/31/2025)

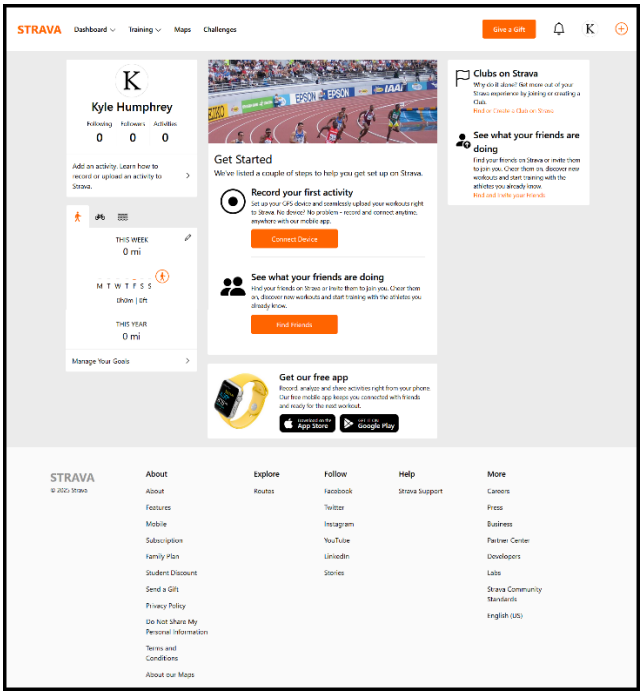
Today I spent the day developing instead of documenting / planning. I made progress, but unfortunately it has only confirmed that my rate of progress is very likely not going to be enough, despite my preparations.

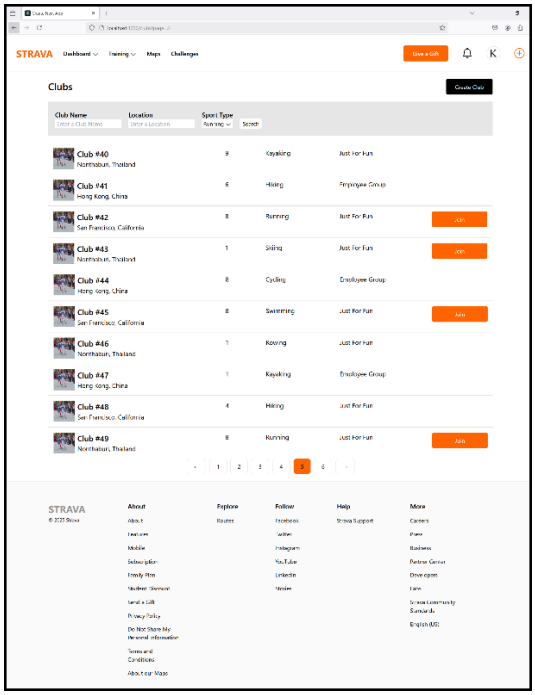
It's alright. In life, I believe not everything is about winning at the cost of everything. What matters more is that you did your best without cheating. That you played fairly and respectfully. That I'm not gonna pretend I did more than I did.

It looks like I have a lot to learn. But I'm gonna still push on and do my best to give a great result.

My Progress

I was only able to do the UI layout for 2 pages over the course of several hours. The pages I worked with were much more complex than I realized, and I had to spend some time working out the more complex features *(larger pictures are available at a later page)*.





Again, like yesterday, all my images are imported from WikiCommons and are either public domain or have a ShareAlike license, which I have given credit to in the **client/public/props/ credits** folder in my latest branch (the **kyle/clubs** branch currently).

Also, I should note that this project, since it is non-commercial, non-advertised, and used only for technical showcase and research, it is ineffectual to the 4 Factors of Fair Use from Section 107 of the U.S. Copyright Act, and thus it falls under fair use.

Yes, I am keeping mindful of legal factors as well, even if it's probably not necessary in this project. If I want to succeed, I want to succeed in the right way.

Technical Highlights

Today I spent most of the day on the Dashboard Page. I was able to create many reusable components that can be used for other upcoming pages. I unfortunately was not able to implement much UI functionality. But the major tasks and functionality I *was* able to implement includes:

Dashboard Page

- Created a New Site Header + Site Footer because it is a different one from the Login Prompt Page
- Dropdown Menu Disappears on Click
- Multi-Tab Functionality
- Using today's date + timezone offset to highlight **Friday** in the MTWT**F**SS Week Display
- Creating reusable components for the Icon Cards (which are on the site a lot)
    - Icons on the left

- Title, subtitle, and a button / link on the right

Clubs Page

- Created Reusable components for Input components
- Created Synthetic Club Data function for UI layout
- Implemented Pagination via URL query and the pagination box

For the UI implementing the color schemes and sizing was also a noteworthy technical highlight. Strava's buttons vary from an orange-background/white-text theming to a white-background/black-text theming. There is also a black-background theming as well, in addition to buttons with different sizes and paddings. I had to come up with a succinct way to implement that while making the code look coherently organized.

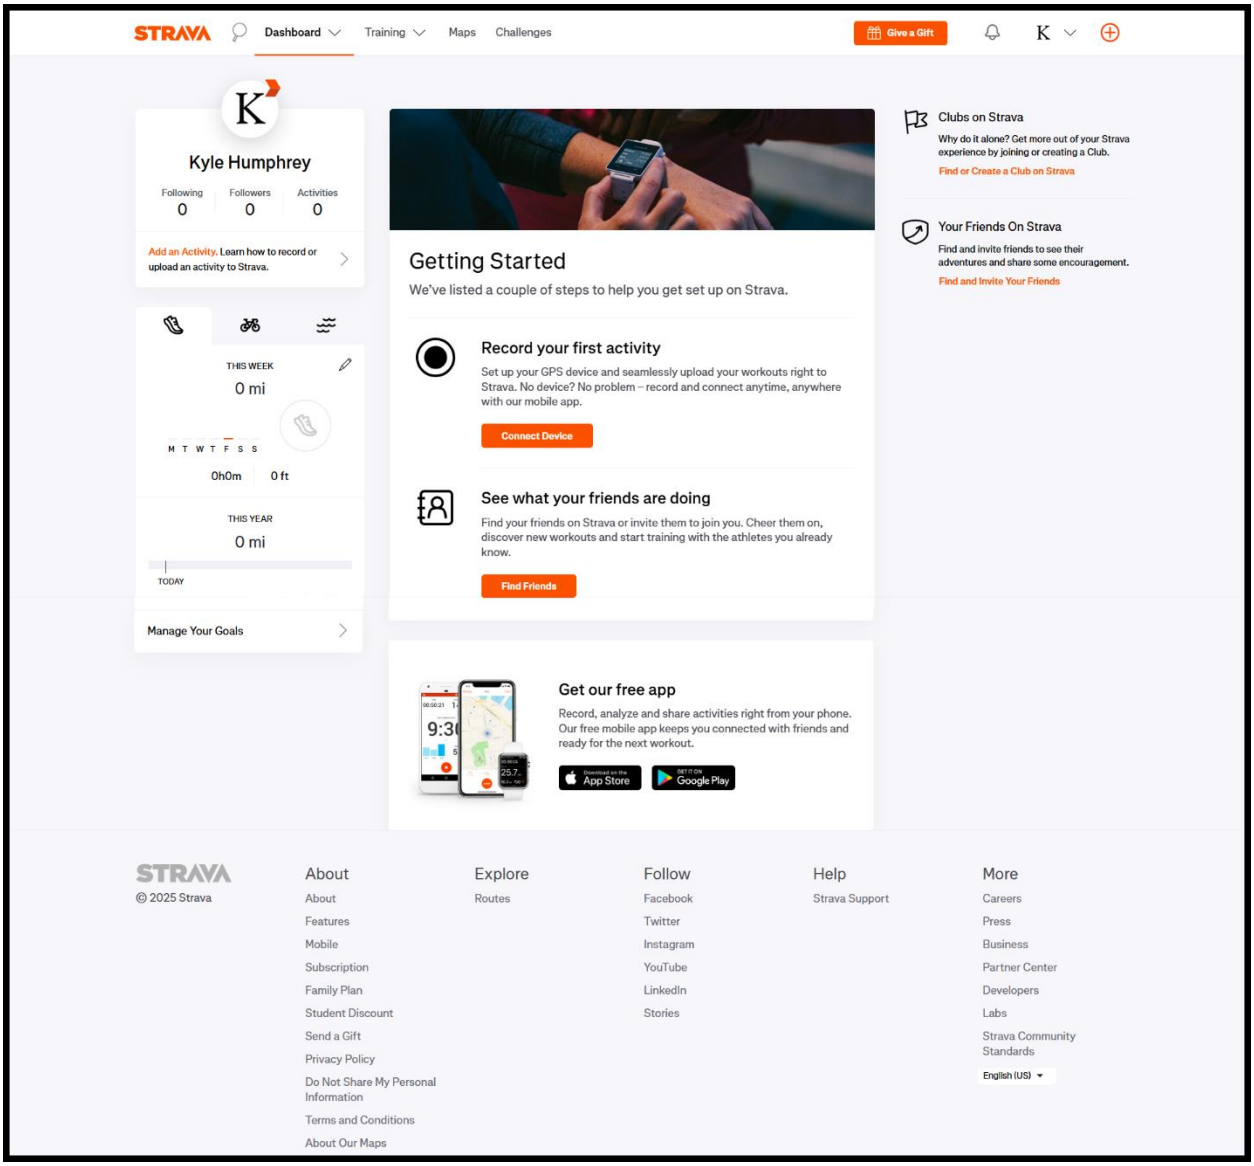
I will keep working to get a good result by Monday.

Note: Unfortunately for the next 24-60 hours, I will have to do other responsibilities and life items. But I will still put in work on this project when I can. And I'm still determined to produce a good result.

The large images are coming up, but I will place them in the next pages for spacing.

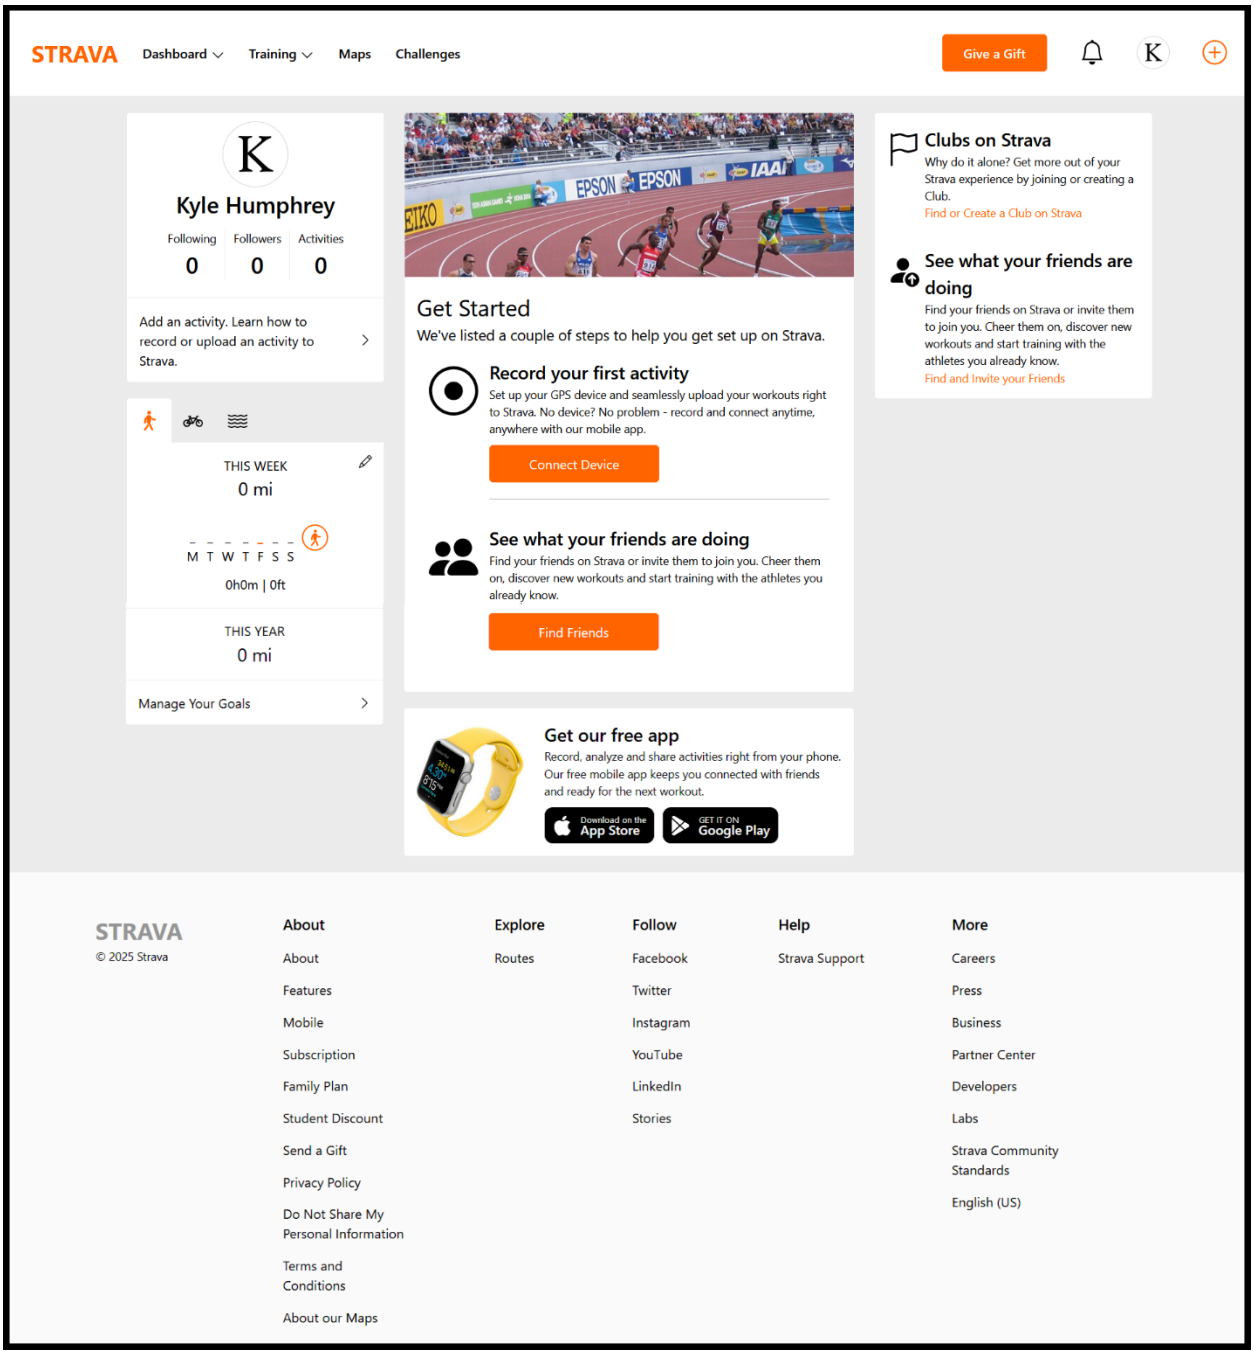
Comparisons – Real Strava Pages + My Coded Strava Pages

Dashboard Page – Real Strava Page

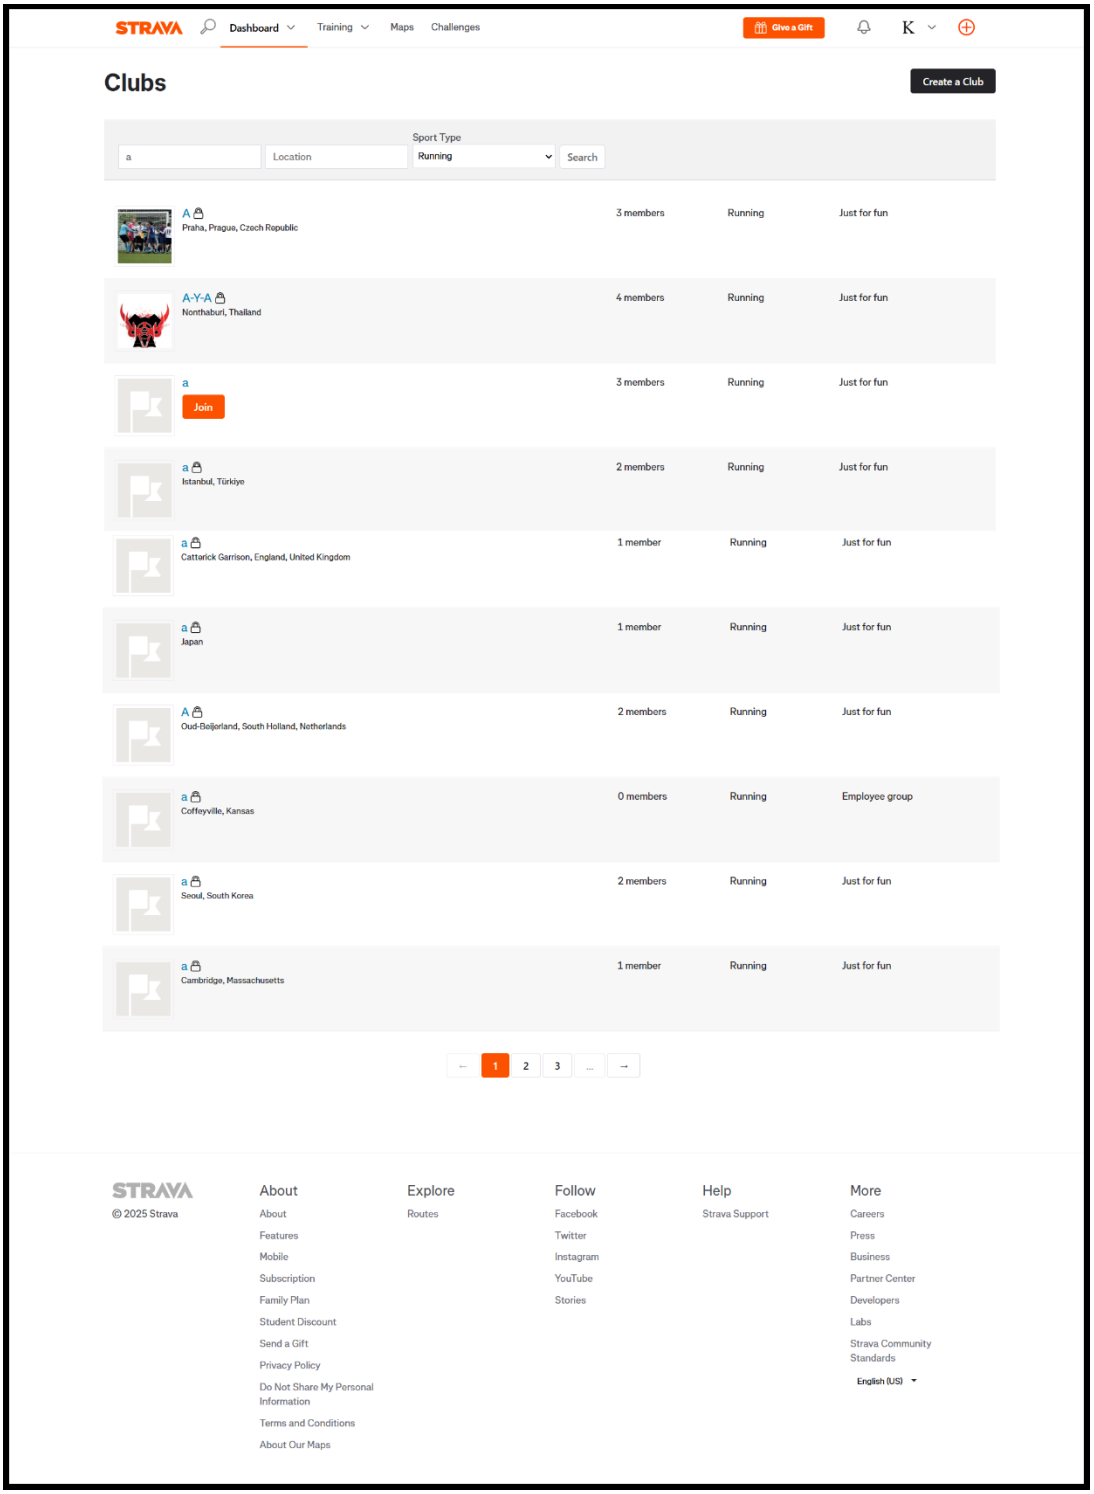


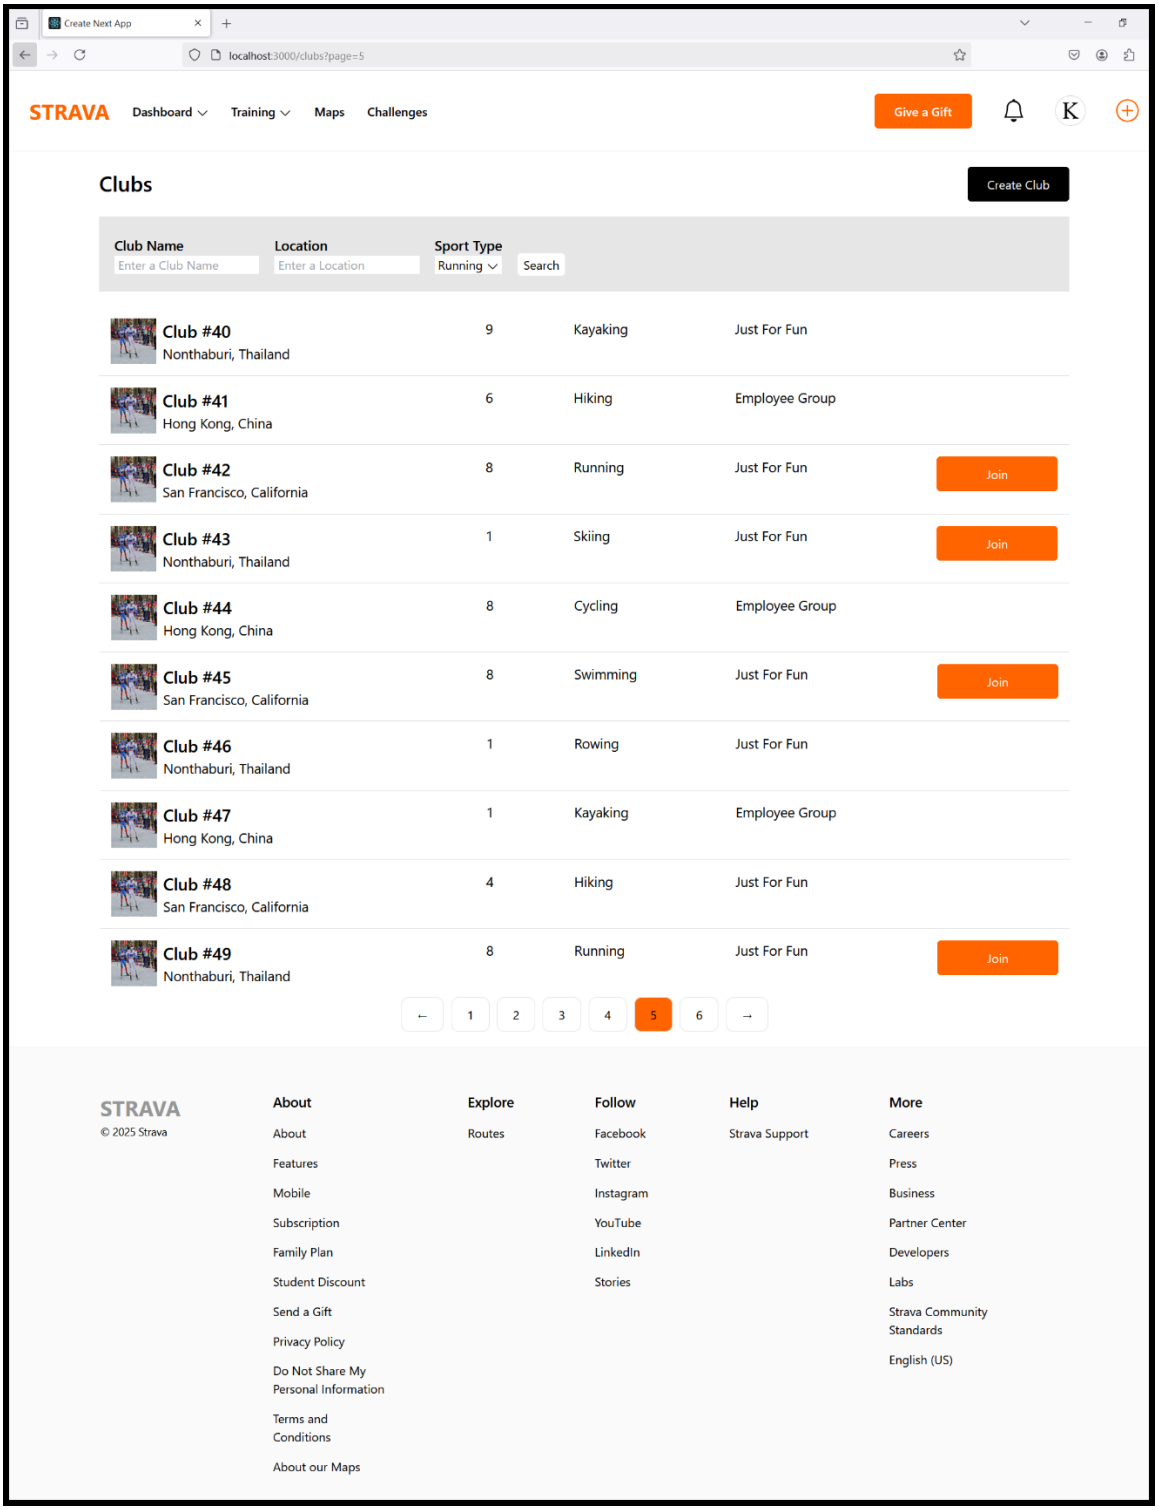
Dashboard Page – My Coded Strava Page for this Project

(I will update these as I progress)



Clubs Page – Real Strava Page



Clubs Page – My Coded Strava Page for this Project


(I will update these as I progress)
